

ABSTRACT

A method for consolidating medical information records that can be access for viewing, storing, retrieving, disseminating and receiving patient medical data via a remote networking system and to be used by authorized multi-users such as hospitals, physicians, paramedics, pharmacies and insurance companies.

Healthcare providers are able to use patient identification card in conjunction with card reader/writer for accessing patient information records as often needed to provide healthcare services for the patient. Authorized individuals also can view the limited database information records via a personal computer and Internet.
